

# Applying a Hybrid Network Approach to Deployment of Self-Driving Mobility Services

**Nadeem Sheikh**

VP, Autonomous Vehicle Programs

1908

Henry Ford begins Model-T production

**1927**

**15 millionth Model-T produced**

# Price comparability by 1927:

Same price (\$250) for 6x speed and range

## HORSE & BUGGY

## FORD MODEL T

# **CHALLENGES FACING DEPLOYMENT**

# **BUILDING A HYBRID NETWORK**

# Consumers are excited about AV

# But operational challenges are significant

1. Expensive to build
2. Can't go a lot of places
3. Can't drive fast
4. Dead miles kill economics

# Consumer Expectations

- **3-5 minute ETAs** in most of the US
- **Low price**
- Interest in self-driving rides as novelty but **most interested in getting from A to B**

**What will a successful AV  
deployment look like?**

# A Hybrid Network...

**HUMAN  
DRIVERS**

**TODAY**

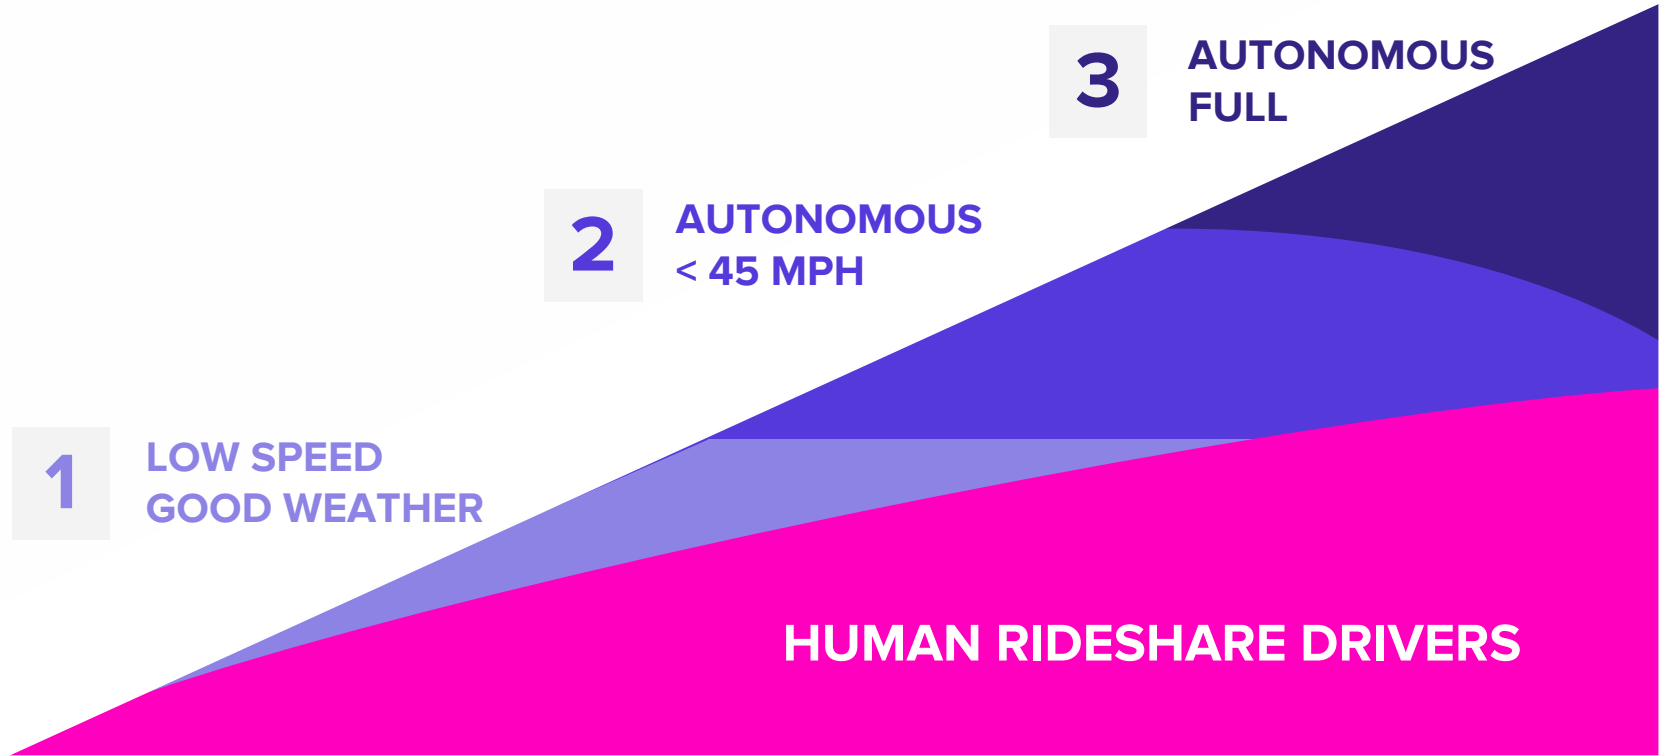

**HUMAN +  
SELF-DRIVING**

**NEXT 10 YEARS**

# ...with incremental deployment

# Keys to effective deployment

**1**

**Know  
WHERE  
to drive**

**2**

**Keep  
COSTS  
LOW**

**3**

**FILL UP  
the  
cars**

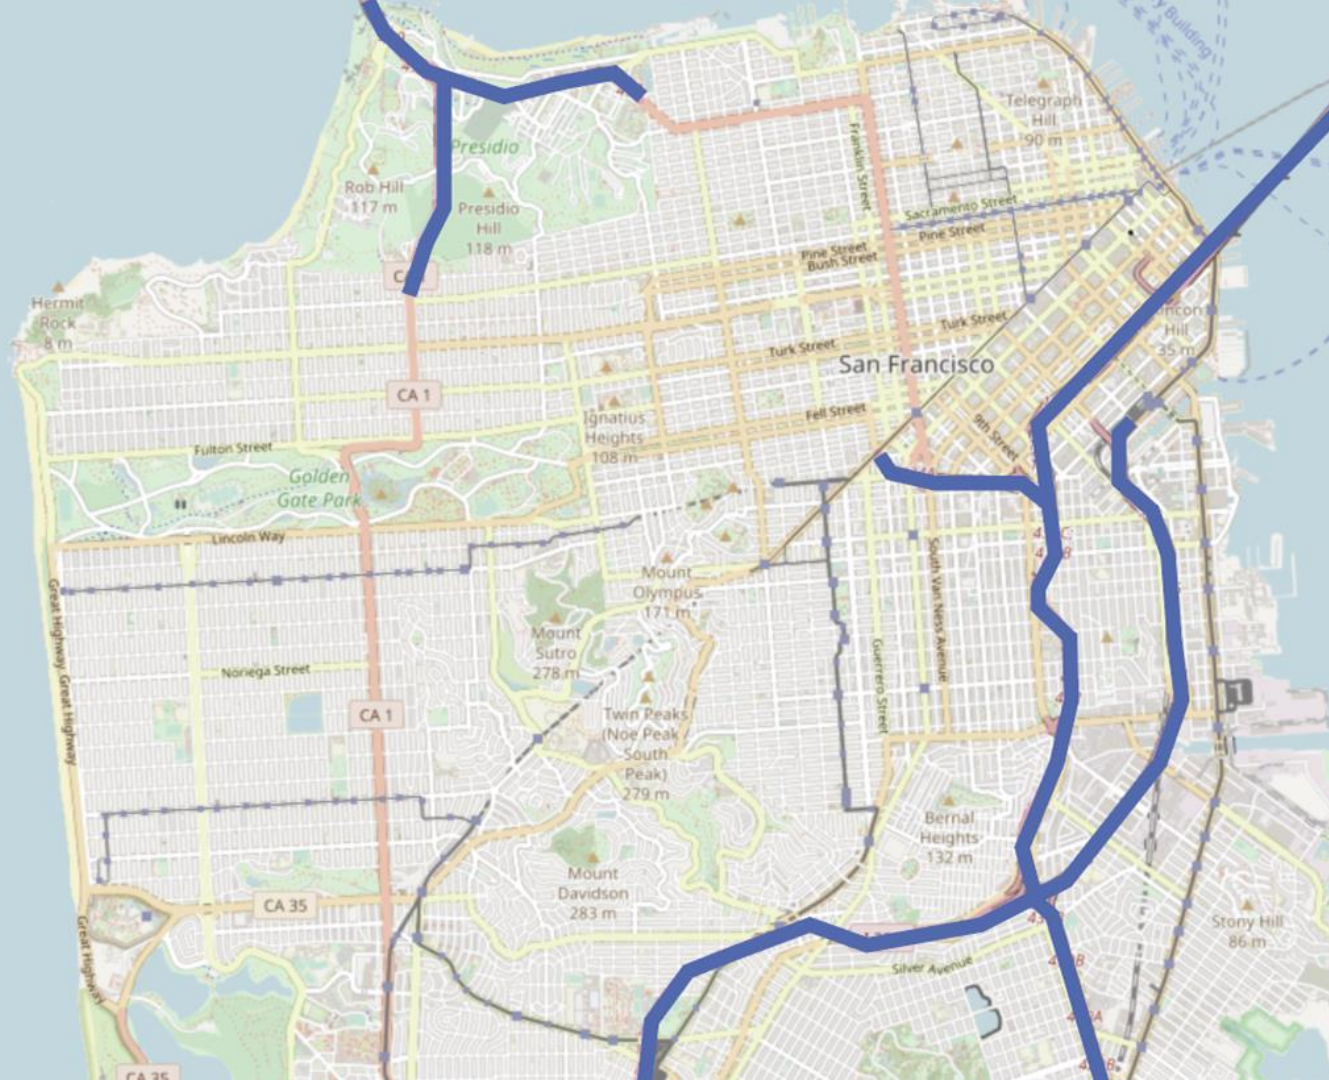

# 1 Where to drive: know the best routes

Lower speeds, limit complex situations & traffic restrictions

- Speeds  $\leq 35$  MPH
- Avoid difficult intersections
- No bike lanes
- Well-marked roads
- Easy pick-up and drop-off

# Remove Highways

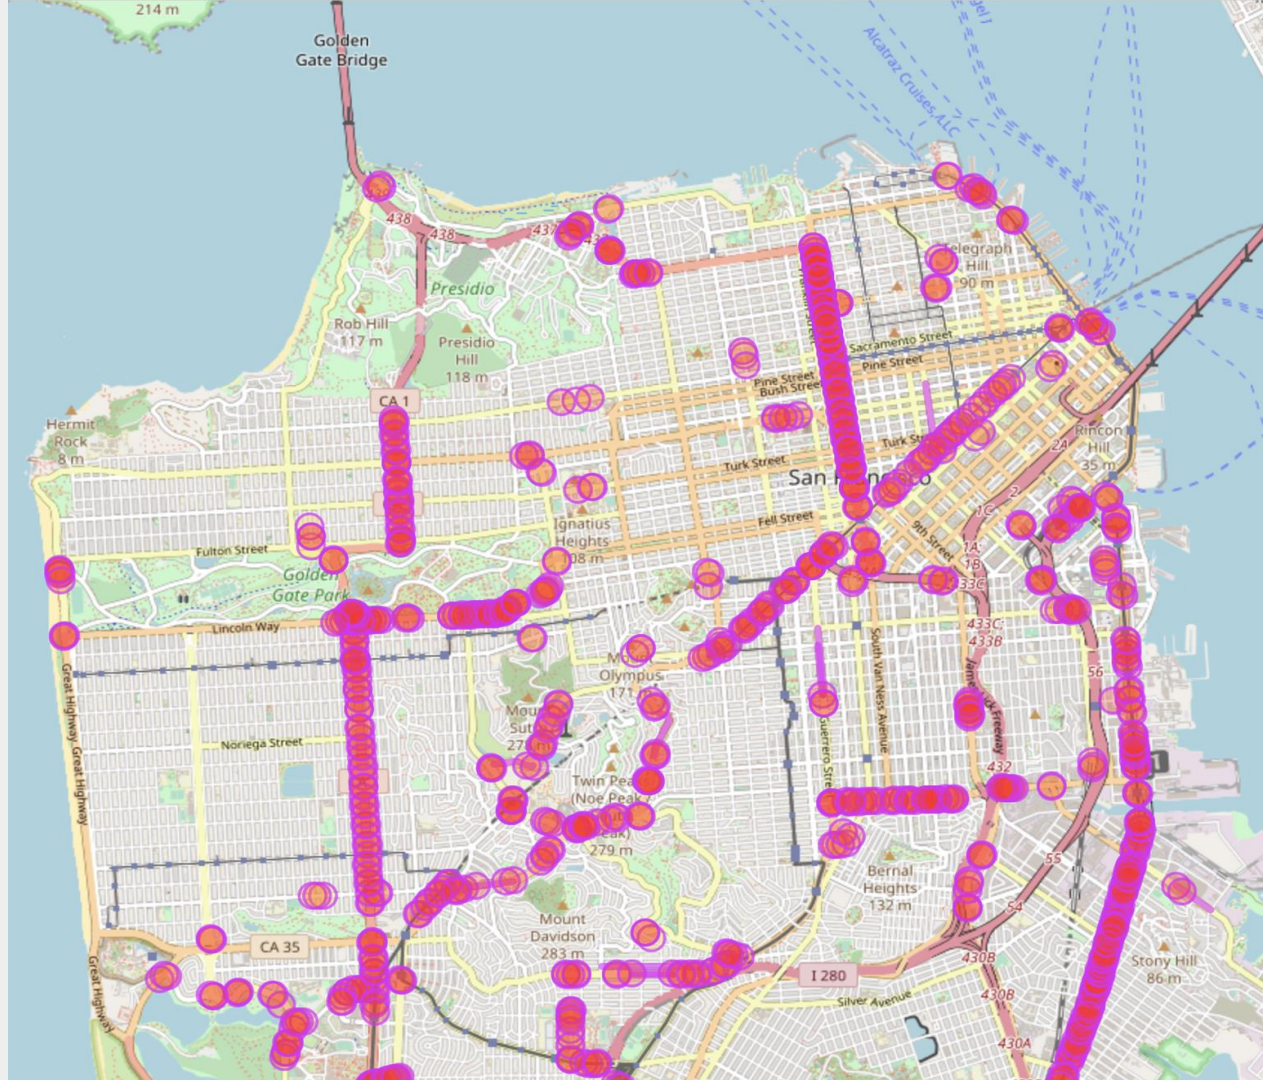

# Remove Bike Lanes

# Remove Difficult Intersections

# Remaining Routes: “AV Eligible”

# Overlay: AV Eligible Demand

# 2

## Low-cost operations

Driver Service Centers for maintenance, cleaning, parking, & charging

## 3 Shared Rides

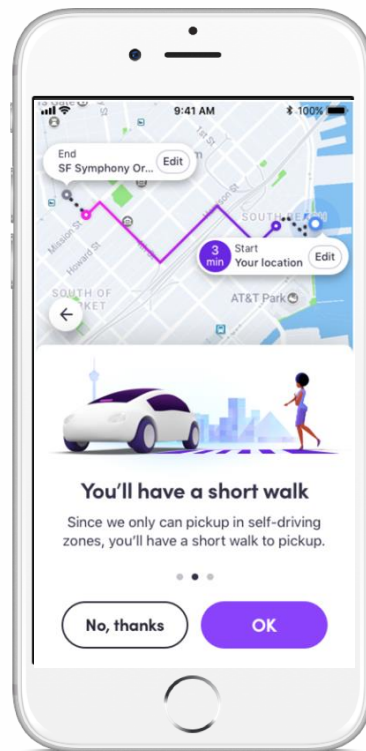

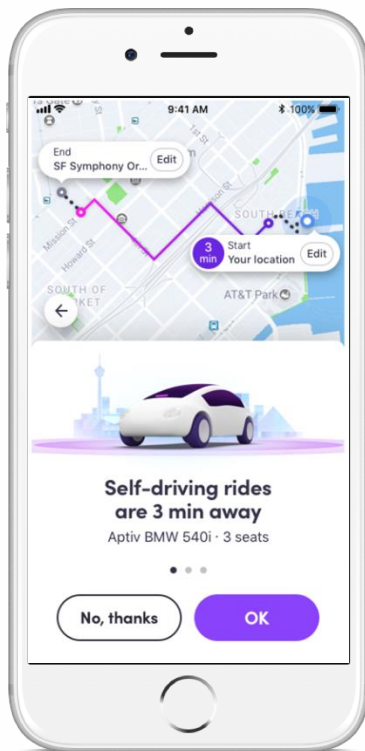

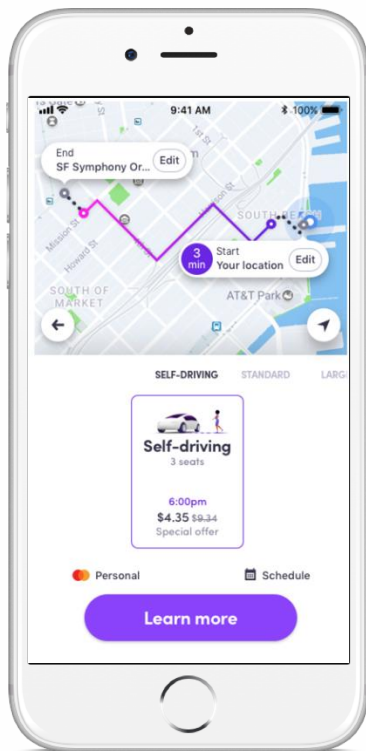

Filling the cars up is essential for cost and congestion

**Shared is 35% of Lyft rides in major markets**

## 3

# Building Shared into AV from day one

# Endgame: Subscription Service

\$9,000 Annual Cost Per Vehicle

Multi-modal subscription that gets you where you need to go

# New possibilities for cities
